

Digital Performance - Hotel Case Study

Thank you for your interest in joining the **Digital Performance** team at Scotiabank!

As part of the interview process, we are asking you to complete a data analytics exercise and present your findings to our team.

Context:

Your role is to analyze data, identify opportunities, and provide tools and recommendations to hotel management to help them achieve their goals and grow their business. In the attached you will find several .csv files that contain information about a hotel (e.g., bookings, food orders, etc.).

Please be aware that, like any data, some files have errors or items could have different names, which could make data classification and analysis difficult.

Exercise goals:

The goal of this technical take home exercise includes:

1. Use analytics tool(s) to transform and visualize data
2. Analyze the data and communicate your findings through a presentation
3. Advise hotel management on their data strategy to support their goals

To answer each exercise question below, please include the following information:

- Code/Files used to transform or visualize the data
- Document any assumptions made

Exercise:

- **Dashboard:** Using the attached files, create a BI dashboard that provides an overview of multiple data trends at the hotel (see BI tool recommendations on the next page). You should come up with a grid for your dashboard showing some key performance indicators (KPIs) in the form of charts, tables, or interactive elements.
- **Presentation:** A deck of maximum 8 slides + Appendix (no limit) to present your findings and recommendations (any tool may be used for visualizations for the slides). The management is keen on identifying growth opportunities and optimize their revenue.
 - One slide with recommendations on other valuable data that the hotel management should consider capturing and why
 - One slide with comments about the data quality and data model (bullet points is fine)

Position: Manager
Department: Digital Performance

Provided below are some recommendations for BI tools (please pick one tool for building the dashboard):

- Power BI Desktop : <https://powerbi.microsoft.com/en-ca/downloads/>
 - Mac users will not be able to install PowerBI directly. We suggest looking into a free trial to get a VM instance, which can have PowerBI installed on it:
<https://azure.microsoft.com/en-us/free/virtual-machines/>
- Tableau (trial link): <https://www.tableau.com/products/trial/desktop>

Please feel free to reach out if you have any questions.

Thank you very much in advance for your interest in this role, and for your time and effort.

Best regards,

The Digital Performance Team
