Analytics Solutions Engineer — Case Study

Role: Analytics Solutions Engineer

Team: Data & Measurement

The scenario

A company has hired a cohort of sales reps over the past three years and run them through onboarding plus ongoing training, coaching, and self-directed learning. The leadership team wants your help answering three questions:

- Is the training and coaching program actually driving sales performance?
- What patterns exist across reps — by territory, team, experience, coach, product — that leadership should act on?
- If leadership asked you to recommend one change to how they invest in enablement, what would it be and why?

They've asked you to come back with a dashboard and a point of view. The audience in the room will be the VP of Commercial, the VP of Sales Enablement, and the Head of Analytics.

The data

You've been provided with seven CSV files. All files share UserID as the primary key for reps; Coaching_Sessions and Managers connect through ManagerID / CoachID. Treat this as a real BI engagement — part of the exercise is forming a view on what the data can and cannot tell leadership.

File	Rows	Description
User_Dimension_Table.csv	150	Sales rep roster. UserID, Name, Team, Territory, AssignedProduct, YearsExperienceAtStart, HireDate, ManagerID, LeftCompanyDate.
Managers.csv	12	Lookup table for manager names. ManagerID, ManagerName.
Sales_Quota_Attainment.csv	~1,675	Quarterly sales quota attainment per rep. UserID, Year, Quarter, SalesQuotaAttainment (percentage).
Training_Scores.csv	~1,745	Annual training scores broken down by category. UserID, Year, TrainingCategory (Product Knowledge, Sales Methodology, Compliance, Soft Skills),

		TrainingScore.
Training_Search_Logs.csv	~3,985	Rep searches on the internal training portal. UserID, Name, SearchTopic, SearchTimestamp, ClickedResult (Yes/No), TimeOnResultSeconds.
Coaching_Sessions.csv	~4,870	Coaching and role-play sessions with managers. SessionID, UserID, CoachID, SessionDate, SessionType (1-on-1, Role Play, Group Session, Shadowing, Pipeline Review), DurationMinutes, FocusArea, RepSelfRating, CoachRating.
Call_Activity.csv	~52,000	Customer call activity. CallID, UserID, CallDate, CustomerSegment, CallType, CallDurationMinutes, ProductDiscussed, Outcome (Meeting Set, No Outcome, Order Placed, Lost, Deferred).

What we'd like you to produce

A Tableau dashboard

Built in Tableau. Tableau Desktop, Tableau Public, or a Tableau Desktop trial license are all fine — whichever you have access to. Submit as a packaged workbook (.twbx) along with any supporting material.

The dashboard should include:

- Interactive filters (territory, team, year, coach, experience level, or others you choose)
- Drill-down capability (team to rep level, year to quarter, or similar)
- At least five different visualization types (bar, line, heatmap, scatter, box plot, tree map, donut, or others you choose)
- At least one calculated field that supports your analytical story
- At least one parameter (year selector, score threshold, or similar)

A live walkthrough

We'll schedule a 60-minute session where you present the dashboard and walk us through your thinking. We'd like to understand:

- Your reasoning for the metrics you chose to include (and exclude)
- The analytical story your dashboard is designed to tell
- Your judgment on what the data can and cannot answer, and what you'd need next
- Your recommendation to leadership on one change they should make
- How you used AI tools during the exercise — what helped, what didn't

You're welcome to bring supporting notes or a brief written document if that helps you present, but we're not scoring written output separately. The walkthrough is the conversation.

What we're looking for

- Analytical judgment — the "why" matters as much as the "what"
- Honest framing — what the data can and cannot tell leadership
- Dashboard craft — design that would hold up in front of a VP, not just an analyst
- A clear recommendation — leadership wants your point of view, not just an analysis
- AI as a working partner — fluent and judicious use of tools in your process
- The ability to defend your choices under questioning

A note on AI usage

We expect you to use AI in whatever ways help you work effectively — from exploring the data, to generating visualizations, to pressure-testing your conclusions. We're interested in the thinking you brought to the exercise and the judgments you made with AI's help, not whether you did everything from scratch.
